

CS 410/510 Introduction to Quantum Computing
Homework 1

Portland State U, Spring 2018
Lecturer: Fang Song

April 4, 2018
Due: April 18, 2018

Instructions. Your solutions will be graded on *correctness* and *clarity*. You should only submit work that you believe to be correct; if you cannot solve a problem completely, you will get significantly more partial credit if you clearly identify the gap(s) in your solution. It is good practice to start any long solution with an informal (but accurate) summary that describes the main idea. For this problem set, a random subset of problems will be graded. Problems marked with “[G]” are required for graduate students. Undergraduate students will get bonus points for solving them. Download the TeX file if you want to typeset your solutions using LaTeX.

You may collaborate with others on this problem set. However, you must *write up your own solutions* and *list your collaborators* for each problem.

1. (Basic Algebra) Let X, Y, Z be the Pauli operators.

(a) (6 points) (complex number) For complex number $c = a + bi$, recall that the real and imaginary parts of c are denoted $Re(c) = a$ and $Im(c) = b$.

- Prove that $c + c^* = 2 \cdot Re(c)$.
- Prove that $|c|^2 := cc^* = a^2 + b^2$.
- What is the polar form of $c = \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}}i$? Use the fact that $e^{i\theta} = \cos \theta + i \sin \theta$?

(b) (6 points) (Trace) Recall the trace of a matrix $M = (m_{ij})_{n \times n}$, $m_{ij} \in \mathbb{C}$ is defined by $\text{tr}(M) := \sum_{i=1}^n m_{ii}$.

- What is $\text{tr}(X|0\rangle\langle 1|)$?
- Show that $\text{tr}(YZ) = \text{tr}(ZY)$. Prove that this holds for general matrices: any $n \times n$ matrices M and N , $\text{tr}(MN) = \text{tr}(NM)$.

(c) (6 points) (Inner product)

- Let $|\phi\rangle = \frac{1}{\sqrt{2}}|0\rangle + \frac{i}{\sqrt{2}}|1\rangle$. $|\psi\rangle = \sqrt{\frac{1}{3}}|0\rangle - \sqrt{\frac{2}{3}}|1\rangle$. Calculate $\langle \phi | \psi \rangle$.
- Show that $X = |0\rangle\langle 1| + |1\rangle\langle 0|$. Express Y, Z in this outer product form too. Calculate $\langle 1 | X | 0 \rangle$ (using linearity).

(d) (10 points) (Tensor product) Recall the *tensor product* of two matrices A and B is $A \otimes B := (a_{ij}B)$.

- Write out the 4×4 matrix representing $X \otimes Y$. Does it equal $Y \otimes X$?
- Show that $(A \otimes B)^\dagger = A^\dagger \otimes B^\dagger$.
- Show that if U and V are unitary matrices, then so is $U \otimes V$.

2. (Quantum states and gates)

- (a) (12 points) In each case, describe the resulting state. $H = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}$.
- Apply H to the qubit $\frac{1}{\sqrt{2}}(|0\rangle + i|1\rangle)$.
 - Apply H to the first qubit of state $\frac{1}{\sqrt{2}}(|00\rangle + |11\rangle)$.
 - Apply H to both qubits of $\frac{1}{\sqrt{2}}(|00\rangle + |11\rangle)$.
 - Apply $\frac{1}{\sqrt{2}} \begin{pmatrix} 1 & i \\ i & 1 \end{pmatrix}$ to both qubits of state $\frac{1}{\sqrt{2}}(|00\rangle + |11\rangle)$.
- (b) (8 points) Let $X = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$ and $Z = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$.
- Suppose we have a qubit and we first apply X and then Z . Is it equivalent to first applying Z and then X ?
 - Suppose we have two qubits. We apply X to both and then Z to both. Is it equivalent to applying Z to both and then applying X to both? Determine your answer by explicitly computing $X \otimes X$, $Z \otimes Z$, and their products both ways.
- (c) (8 points) (SWAP gate) A SWAP gate takes two inputs a and b and outputs b and a ; i.e., it swaps the values of two input registers. Show how to build a SWAP gate using only CNOT gates. (Hint: you'll need 3 of them.)
3. (Product states versus entangled states) In each of the following, either express the 2-qubit state as a tensor product of 1-qubit states or prove that it cannot be expressed this way.
- (4 points) $\frac{1}{2}|00\rangle + \frac{1}{2}|01\rangle + \frac{1}{2}|10\rangle - \frac{1}{2}|11\rangle$
 - (4 points) $[G] \frac{3}{4}|00\rangle + \frac{\sqrt{3}}{4}|01\rangle + \frac{\sqrt{3}}{4}|10\rangle + \frac{1}{4}|11\rangle$
4. (Distinguishing states by local measurements) Suppose Alice and Bob are physically separated from each other, and are each given one of the qubits of some 2-qubit state. They are required to distinguish between State I and State II with only local measurements. Namely they can each perform a local (one-qubit) unitary operation and then a measurement (in the computational basis) of their own qubit. After their measurements, they can send only classical bits to each other. (This is usually referred to as LOCC: local operation and classical communication.) In each case below, either give a perfect distinguishing procedure (that never errs) or explain why there is no perfect distinguishing procedure (i.e., that for any procedure the success probability must be less than 1).
- (5 points) State I: $\frac{1}{\sqrt{2}}(|00\rangle + |11\rangle)$; State II: $\frac{1}{\sqrt{2}}(|01\rangle + |10\rangle)$
 - (5 points) State I: $\frac{1}{\sqrt{2}}(|00\rangle + |11\rangle)$; State II: $\frac{1}{\sqrt{2}}(|00\rangle - |11\rangle)$
 - (5 points) $[G]$ State I: $\frac{1}{\sqrt{2}}(|00\rangle + i|11\rangle)$; State II: $\frac{1}{\sqrt{2}}(|00\rangle - i|11\rangle)$

5. (Simulate classical circuit) Let $f : \{0,1\}^2 \rightarrow \{0,1\}^2$ be a function such that $f(ab) = 0$ if $a = b = 1$ and $f(ab) = 1$ otherwise.
- (a) (4 points) Design a circuit using your favorite gate set (e.g., AND, OR, NOT) to compute f .
 - (b) (6 points) Turn your circuit into a reversible circuit using Toffoli gate $T : a, b, c \mapsto a, b, a \wedge b \oplus c$ and other reversible gates. You may need to introduce ancilla bits
 - (c) (6 points) Turn your reversible circuit into a unitary quantum circuit that implements the unitary $U_f : |x\rangle|y\rangle \mapsto |x\rangle|f(x) \oplus y\rangle$.
